Color

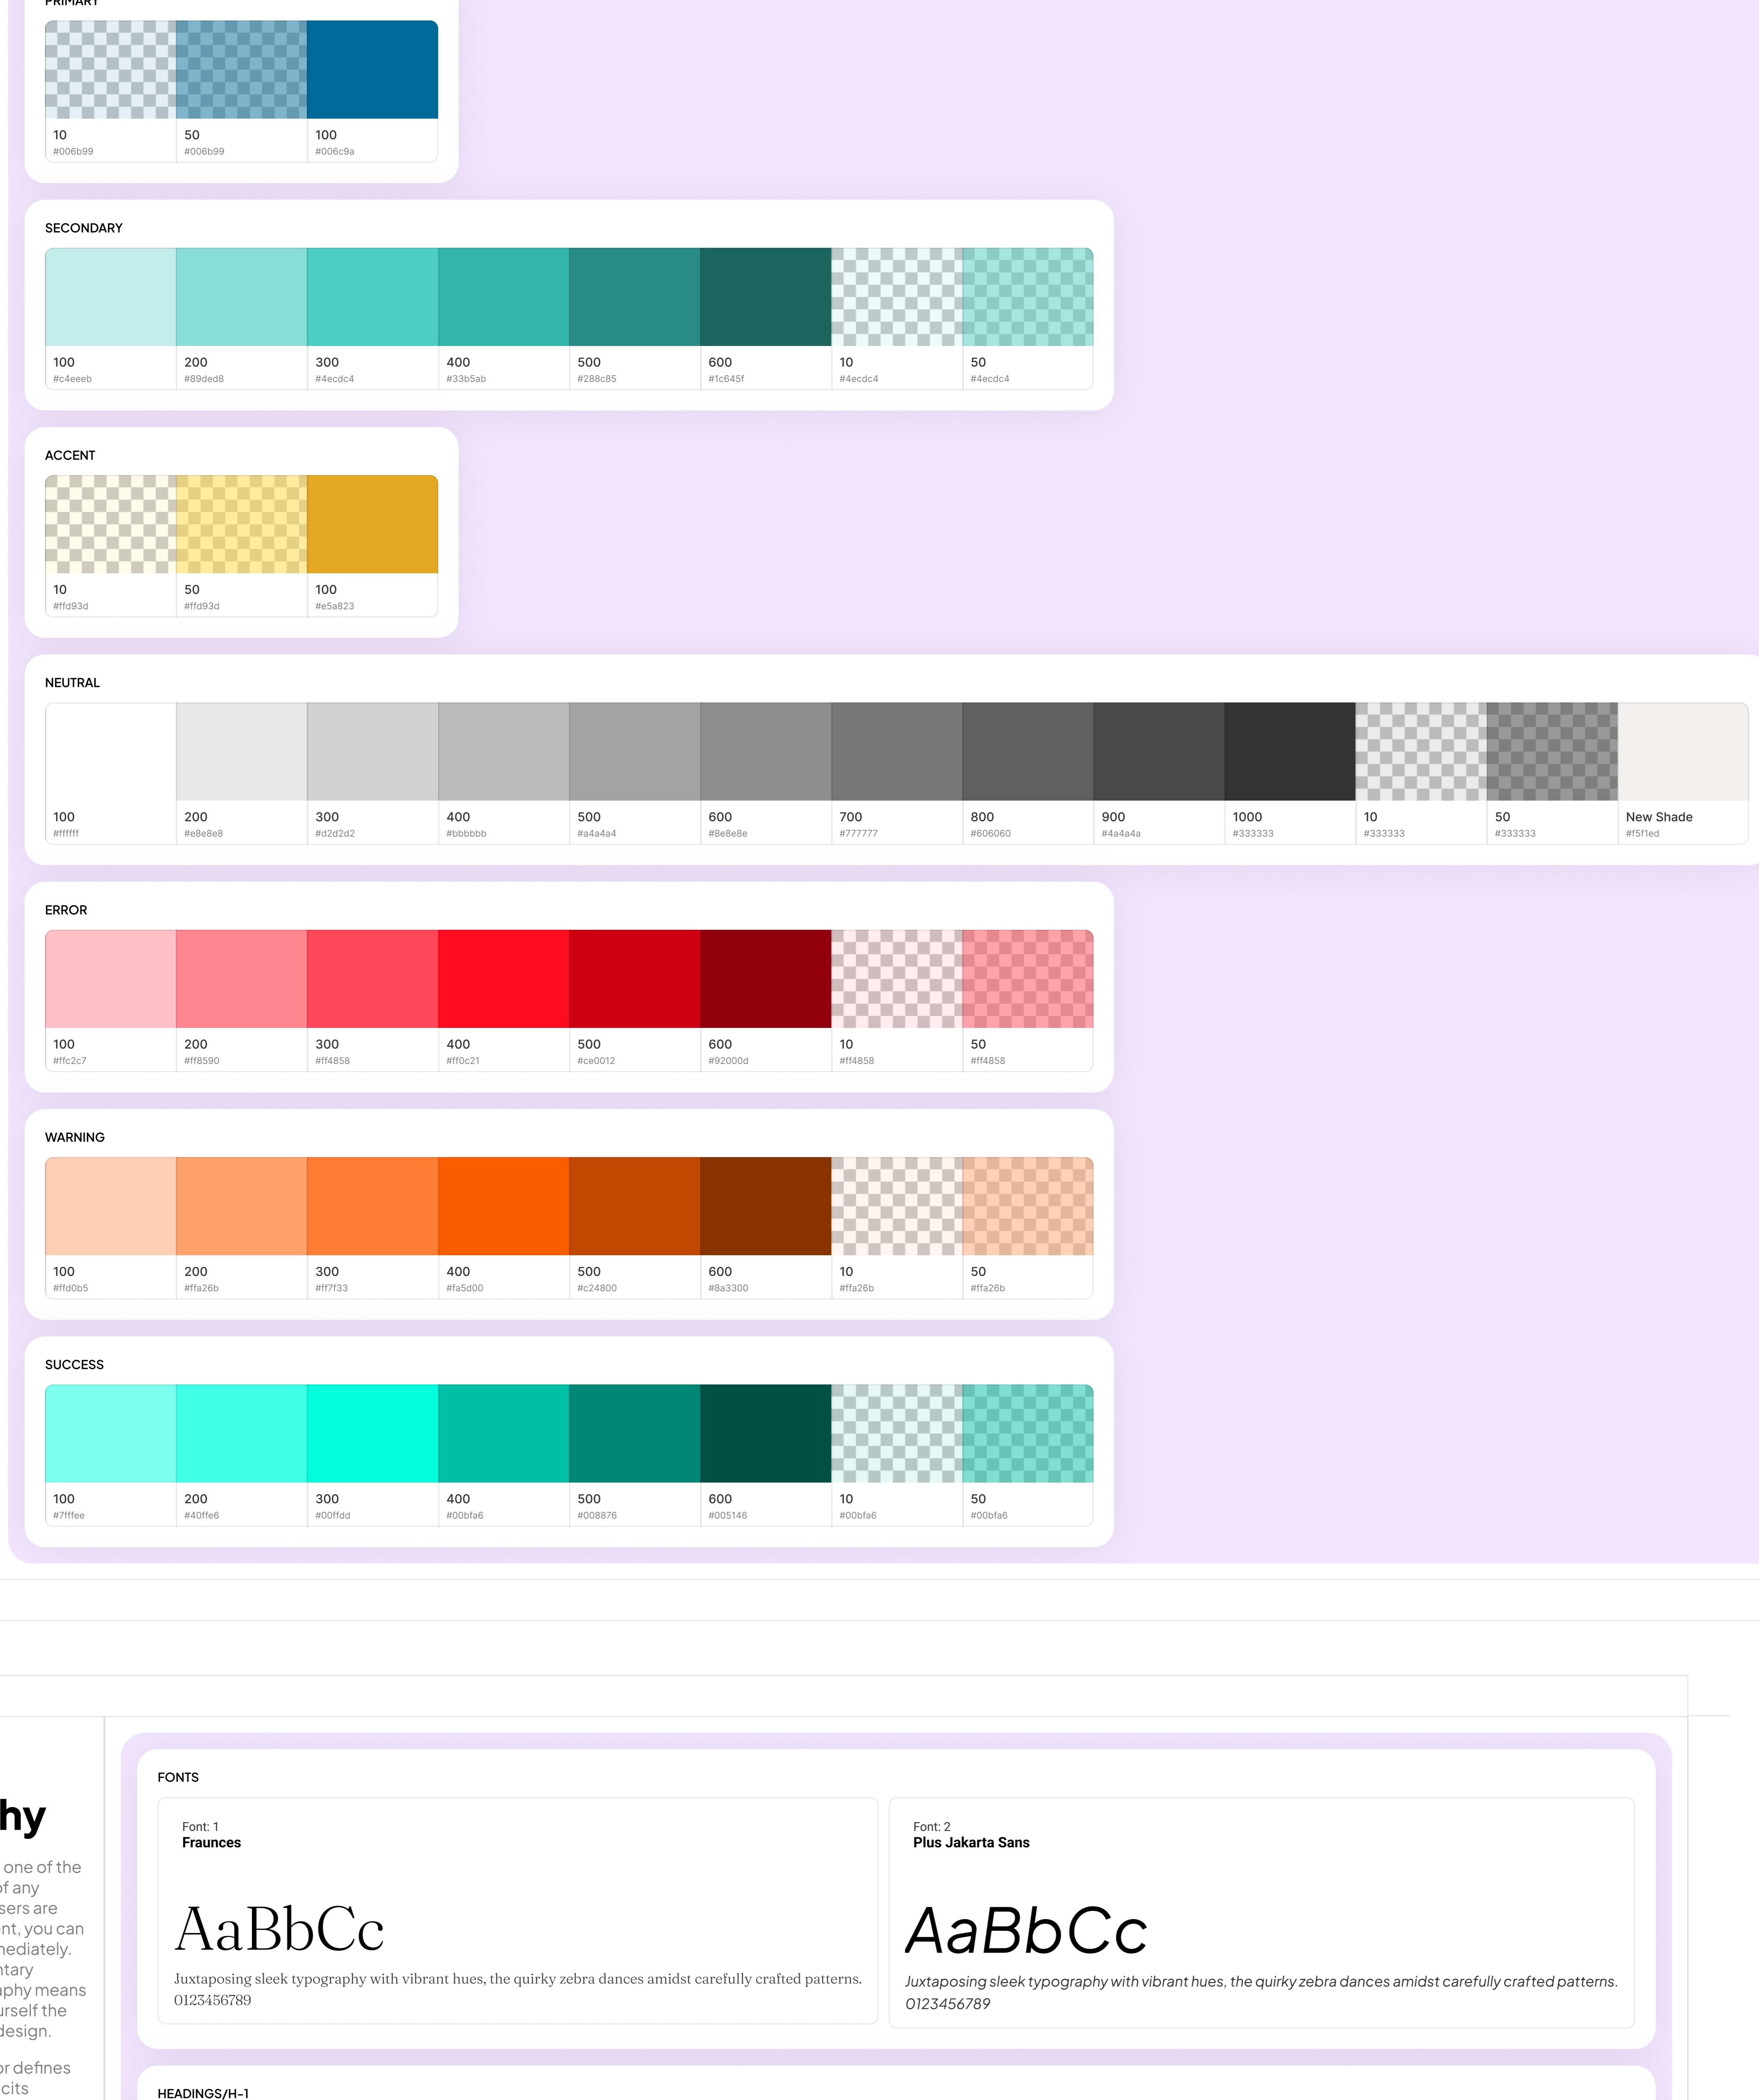

A color palette is simply a set of colors that work well together, combined to form a brand or a concept.

Primary colors: Your brand color defines the interface's feel and elicits emotion, used consistently across interactive elements.

Neutral colors: Gray is foundational in UI design, used for text, form fields, backgrounds, and dividers.

Accent colors: Secondary to the primary color, these grab attention and support brand identity in components like labels.

Feedback colors: Highlight semantic states to provide visual feedback and warnings during interface use.

Typography

The typography system is one of the most foundational parts of any interface design. If your users are unable to read your content, you can say goodbye to them immediately. That's why even a rudimentary understanding of typography means you can determine for yourself the best fonts for modern UI design.

Heading: Your brand color defines the interface's feel and elicits emotion, used consistently across interactive elements.

Body: Gray is foundational in UI design, used for text, form fields, backgrounds, and dividers.

Button

The Button component triggers actions or navigation when clicked. Use it for form submissions, initiating processes, or linking to other pages within the interface.

These are the designed specifically to help you perfect your components before exporting.
